[Dual C-Core Output Transformer](#)

A high-quality output transformer is the heart of the tube amplifier. A poor output transformer fitted in a well-designed amplifier will spoil its performance.

Needless to say that the design and optimization of an output transformer takes high skill and know-how because performance requirements are complex and high. The transformer must deliver adequate and constant power without core saturation. It should provide wide frequency bandwidth at a minimum distortion. Moreover, it should provide a constant outstanding performance to retain the open, spacious qualities of recorded music.

The sound quality of [Dibao Dual C-Core Output Transformer](#) is exceptional: low distortion and an extremely wide frequency and dynamic range. It has a double C core and has been carefully wound, has no internal solder joints, is impregnated and encapsulated in metal housing. There are four threaded mounting bolts for easy installation.
